General Introduction

Students reading the Chemical Engineering Tripos normally progress as follows:

- 1st year: Part IA Natural Sciences Tripos or Part IA Engineering Tripos
- 2nd year: Part I Chemical Engineering Tripos (CET I)
- 3rd year: Part IIA Chemical Engineering Tripos (CET IIA)
- 4th year: Part IIB Chemical Engineering Tripos (CET IIB)

Progress is dependent on satisfactory performance in the previous year's course – honours standard in CET I is sufficient to do CET IIA. Students are normally required to achieve class II.2 or higher in CET IIA in order to progress to CET IIB.

Please note, this Syllabus document was correct at the time of printing. However, changes may occur during the year due to unforeseen circumstances.

The educational aims of the overall Chemical Engineering Tripos are to:

- give a sound education in the fundamentals of Chemical Engineering;
- develop the skills and confidence necessary for the solution of problems in the chemical, biochemical and allied industries;
- produce graduates of the highest calibre;
- provide an education accredited by the Institution of Chemical Engineers.

Outline of Part I Chemical Engineering Tripos (CET I)

In Part I students gain a broad exposure to the core Chemical Engineering topics.

There are lecture courses on:

- Fundamentals: process calculations; fluid mechanics; biotechnology fundamentals; heat and mass transfer fundamentals
- Process operations: separations; homogeneous reactors; biotechnology operations; heat and mass transfer operations
- Process systems: introductory chemical engineering
- Mathematics: engineering mathematics
- Enabling topics: stress analysis and pressure vessels; mechanical engineering for those who read Natural Sciences in the first year; introductory chemistry for those who read Engineering in the first year

In addition, students are required to undertake classes on:

- Exercises
- Chemical Engineering laboratory
- Engineering drawing: for those who read Natural Sciences in the first year
- Physical chemistry laboratory: for those who read Engineering in the first year

Full details of these courses are provided in the Part I Syllabus Document.

Students for Part I will take four written examination papers. Papers 1-3 will be taken by all students. Paper 4(1) will be taken by students who read Natural Sciences in the first year, and Paper 4(2) will be taken by students who read Engineering in the first year. The format of examinations and weighting of written papers and project work is given in the Form and Conduct Notice published each year by the Chemical Engineering and Biotechnology Syndicate.

Outline of Part IIA Chemical Engineering Tripos (CET IIA)

In Part IIA students continue their study of core chemical engineering topics, both by extending subjects that were introduced in Part I and by being exposed to new topics.

There are lecture courses on:

- Fundamentals: advanced fluid mechanics; equilibrium thermodynamics; radiative heat transfer; corrosion and materials
- Process operations: heterogeneous reactors; separations; bioprocessing; particle processing
- Process systems: process dynamics and control; process synthesis; safety, health and environment
- Mathematical methods: partial differential equations; statistics
- Enabling topics: process design

In addition, students are required to undertake:

- Exercises
- Design project
- Engineering ethics

Full details of these courses are provided in the Part IIA Syllabus Document.

Students for Part IIA will take four written examination papers. These examinations are near the start of Easter term, after which the Design Project takes place. The format of examinations and weighting of written papers and project work is given in the Form and Conduct Notice published each year by the Chemical Engineering and Biotechnology Syndicate.

Rather than staying on for Part IIB, students may graduate with a B.A. degree after successfully completing Part IIA. Students leaving at this stage have not fully completed the academic requirements of the IChemE for becoming a Chartered Engineer.

Outline of Part IIB Chemical Engineering Tripos (CET IIB)

Part IIB is a Master's-level course that gives students a deeper understanding of some fundamental subjects, introduces a range of specialist areas of knowledge, and provides an opportunity for broadening their education.

Topics in Groups A and D are compulsory. Students are required to take a total of six modules from Groups B and C, of which at least two must come from Group B and at least two must come from Group C. Further, at least two of the six modules chosen from Groups B and C should be assessed principally or entirely by written examination.

Group A consists of the following compulsory topics.

- Sustainability in Chemical Engineering
- Energy Technology
- Chemical Product Design

Group B consists of advanced chemical engineering topics.

- Advanced Transport Processes
- Interface Engineering
- Pharmaceutical Engineering
- Adsorption and Advanced Nanoporous Materials
- Fluid Mechanics and the Environment
- Electrochemical Engineering

Group C consists of broadening material topics.

- Optical Microscopy
- Healthcare Biotechnology
- Biophysics
- Biosensors and Bioelectronics
- Foreign Language

The Group D topic is a compulsory project. Each student undertakes a research project, usually in collaboration with another student, supervised by a member of staff.

Full details of these courses are provided in the Part IIB Syllabus Document.

The format of examinations and weighting of written papers and project work is given in the Form and Conduct Notice published each year by the Chemical Engineering and Biotechnology Syndicate.

Students graduate with B.A. and M.Eng. degrees after successfully completing Part IIB. Provided they performed satisfactorily in the design component, they have satisfied the academic requirements of the IChemE for becoming a Chartered Engineer.

Student Workload Statement

It is expected that students will:

- attend and be attentive in all lectures and related classes;
- complete all assignments to a satisfactory standard by the imposed deadlines;
- prepare properly for all College supervisions;
- work in the vacations on consolidation, revision, exam preparation and any coursework.

The normal workload for a typical chemical engineering student is 45 hours each week during term. However, this is not a hard and fast figure. Some students work intensely and can achieve a great deal in an hour. Other students work less efficiently. In an ideal world, students would work on a particular task (problem sheet, lab write-up, exercise report) until the desired learning outcomes have been achieved. That said, students are advised not to spend significantly more time on work than the typical workload on a frequent basis. For supervision work, while it can be useful educationally for a student to battle through a problem to reach a solution (even if it takes a long time), it is perfectly acceptable for a student to "give up" after a decent effort and go on to the next question. One of the roles of supervisions is for students to ask for help on questions that they cannot answer. Question & Answer sessions and demonstrator assistance are also provided for much of the coursework to assist students.

Student Feedback

The Department of Chemical Engineering and Biotechnology has a strong tradition of good relations between staff and students and takes student feedback seriously.

You will be asked to complete a questionnaire on each lecture unit when it finishes. You will also be asked to complete an end-of-year questionnaire on the overall course. Please take time to fill these in. Staff very much value receiving constructive comments.

If there are any problems with teaching in the Department, please tell the lecturer or course organiser. It is a good idea to tell the organiser before the end of the course because it may be possible to rectify the problem. However, if the problem persists, please contact either Rachael Tuley, rlt23@cam.ac.uk or Helen Stevens Smith, <u>hcs24@cam.ac.uk</u>. If you would like to remain anonymous, your name can be removed before passing on to the relevant academic staff.

If there are any problems with College supervisions, then please tell your Director of Studies or Senior Tutor.

A further feedback mechanism within the Department is provided by the Staff-Student Consultative Committee (SSCC). This is the formal forum in which students comment on issues concerning life in the Department. Two student representatives will be elected from each undergraduate year group early in Michaelmas term to serve on this Committee. Meetings are held at least twice a year.

There is also an undergraduate representative on the Chemical Engineering and Biotechnology Syndicate. This is the University body that is responsible for overseeing the running of the Department – it is the equivalent of a Faculty Board. The election of the undergraduate representative to the Syndicate takes place late in Michaelmas term.

Chemical Engineering Tripos: information on plagiarism

The University's website on plagiarism makes the following statement:

"Plagiarism is defined as submitting as one's own work, irrespective of intent to deceive, that which derives in part or in its entirety from the work of others without due acknowledgement. It is both poor scholarship and a breach of academic integrity."

The open literature, including web-based literature, is available for you to consult. Discussions about continually assessed work with other students, or with demonstrators or supervisors, can be beneficial, and we wish to encourage such discussions. However, any work that you submit for assessment must represent your own knowledge and understanding and not that of someone else. When you draw on the work of others, e.g. words, facts, data, ideas, diagrams, and software, you must acknowledge the source with an appropriate citation.

Any attempt to pass off the work of others as your own is a serious offence. If plagiarism (which includes unauthorised collusion) is detected, the Examiners will award a mark which reflects the underlying academic merit and extent of a candidate's own work. Further, the case may be referred to the Senior Proctor, the University Advocate, or taken to the University's Court of Discipline, depending on the nature of the offence.

Moreover, as well as not copying the work of others, you should not allow another person to copy your work. If you allow another person to copy your work, you may be found guilty of assisting an attempt to use unfair means.

Some continually assessed work is designed to be carried out individually, and some in collaboration with other students. The specifications regarding the manner of working and reporting are shown in the Student Collaboration Table below.

Information about the University's policy and procedures on plagiarism can be found at http://www.admin.cam.ac.uk/univ/plagiarism/

The University Library provides a Guide on Good Academic Practice and Avoiding Plagiarism here: <u>https://libguides.cam.ac.uk/plagiarism</u>

Plagiarism Quiz

At the start of the academic year, you will be asked to complete the Plagiarism Quiz on Moodle. Links will be provided to all cohorts at the start of term. All students must take the quiz. Successful completion of the quiz confirms that you have read and understood the policies and procedures of the Department and the University on plagiarism.

Student Collaboration T	able 2021/2022
-------------------------	----------------

Level	Course	Instructions	
CET I	Exercises	You must work as an individual.	
CET I	Chemical Engineering Laboratory	You normally work in a group of two. You may collaborate with the other member or members of your group in conducting experiments and theoretical investigations, but your reports must be written independently.	
CET I	Engineering Drawing	You must work as an individual.	
CET I	Physical Chemistry Laboratory	You normally work in a group of two. You may collaborate with the other members of your group in conducting experiments and theoretical investigations, but your reports must be written independently.	
CET IIA	Engineering Ethics	You must work as an individual.	
CET IIA	Exercises	You must work as an individual.	
CET IIA	Design Project	Because the projects are carried out in groups, cooperation between members of each group is essential. However, collaboration between different groups, and exchange of information, drawings, text, calculations and computer files, other than that which takes place at office hours and seminars, is prohibited. The report and associated calculations must represent the work only of the members of the group.	
CET IIB	Chemical Product Design	Because some of the work is carried out in groups, cooperation between members of each group is essential. However, collaboration between different groups, and exchange of information, drawings, text, calculations and computer files, other than that which takes place during and following workshops and seminars, is prohibited. All individual reports must be written individually.	
CET IIB	Research Project	You normally work in pairs, in which case you may collaborate with your partner in conducting experiments and theoretical investigations, but your reports must be written independently. If you work with a research group, you may collaborate with members of the group on experimental and theoretical investigations. However, your report must be written independently, and you should clearly state the assistance provided by other members of the research group.	
CET IIB	Foreign Language	You must work as an individual.	
CET IIB	Biosensors and Bioectronics	You must work as an individual when specified. When it is specified that you should work in a group, you may collaborate with the other members of your group in conducting experiments, theoretical investigations, and design exercises but your reports must be written independently.	

Unit				
Sustainability in Chemical Engineering				
Level	Term		Duration	
CET IIB		LT 2022	12 lectures	
<i>Background</i> Achieving the state of making in most indust principles of sustainab engineering in attainin	Background Achieving the state of sustainability is seen as a critical societal challenge. It is a major factor in decision making in most industries employing chemical engineering graduates. This course will examine the foundation principles of sustainability, sustainability challenges in specific application areas and the role of chemical engineering in attaining the goals of sustainable development.			
Aims				
This course provides a the conceptual framew with respect to its imp	n overview of sustainal ork and apply quantitat act on sustainability.	bility in a chemic tive methods to t	cal engineering context. The aim is to establish the analysis of chemical engineering technology	
Learning Outcomes				
 After completing this course and the associated problem sheets, students should be able to: Understand the concept of sustainability as a system's problem Understand basic concepts of general systems theory in application to technology systems Understand basic principles of environmental ecology; understand interaction of technological and environmental systems and their interconnections Describe principles of life cycle thinking; practically apply life cycle analysis to simple chemical processes Use thermodynamic analysis of simple chemical systems; be able to calculate exergy of chemical processes and use it to evaluate process efficiency. Describe the water-energy-food nexus – an example of a system's problem. 				
Assumed Knowledge				
<i>Material</i> Thermodynamics			Source CET I Process calculations CET IIA Equilibrium thermodynamics	
Connections To Other	· Units			
This course builds on material taught in CET I and CET IIB.				
Self Assessment				
Exercises within lectures and additional exercises made available to students for self study and self assessment. Interactive sessions during the scheduled sessions also include elements of self-assessment and peer assessment.				
Assessment				
The material from this unit is assessed by coursework.

Unit	Staff
Chemical Product design	Professor Geoff Moggridge

Chemical engineering shares with other engineering disciplines a tradition of courses in design. In these courses, students use what they have learned to come up with new solutions to relevant problems. Normally, these problems have centered on chemical processes. For example, students can design an ammonia synthesis plant, or a cryogenic distillation unit for air separation.

This design experience has been a mainstay of the profession for over fifty years. It has successfully prepared students to work for large multi-national companies which make commodity chemicals. It has served the profession well.

However, over recent decades, fewer students have gone to work for these commodity chemical companies. Increasing numbers take jobs in specialty chemicals, consumer products, and biomedical industries. Some of these jobs are in start-up companies. For students anticipating this type of career, process design is not as relevant, but there is and will be in the future, more emphasis on the design and manufacture of high added value products.

The focus of this course is on product, not process design. An example of such products, which chemical engineers are involved in designing, is pharmaceuticals. In a special edition of this course, in recognition of the key role vaccine development has played in tacking the SARS-CoV-2 pandemic, the course this year will focus primary on how to develop, scale up and distribute medical products. This will be delivered in collaboration with an industrial partner.

Topics discussed will include:

- Regulatory framework
- Reactor design and scale up for vaccines
- Separation design and scale up for vaccines
- Delivery methods
- Evolution of disease and vaccines
- Product to person
- Economics of a vaccine
- The broader context of the pharmaceutical industry

Classes will be organized into short sections of lectures interspersed with interactive group or individual tasks. These sessions will provide the basis for pieces of continually assessed work, by written report, oral presentation and/or recorded videos. Effective group working is an essential part of the course and assessment.

Teaching Materials

JSD 9/2021	AJS	Group B: Advan	eed Chemical Engineering Topics

Unit	Staff
Advanced Transport	Professor J.S. Dennis
1	

1. Mass and Energy Transport in a Binary System.

- understanding advective and diffusive fluxes in binary systems.
- 2. Multicomponent Diffusion Stefan-Maxwell Equations.
 - derivation of equations, including a consideration of non-equilibrium thermodynamics.
 - to understand what happens in a diffusing system when there are more than two components and there are significant changes in concentration, as in a practical catalyst. Limitations of Fick's Law.
- 3. Interphase Mass Transfer: Gas-Liquid Mass Transfer
 - how to calculate the rate of transfer between a gas and liquid when the gas reacts with the liquid at a finite rate. Time-dependent aspects of gas absorption.
- 4. Time-Dependent PDEs Revision and Extension
 - an extension of material covered in Part IIA PDEs to allow solution of time-dependent transport problems.
- 5. Reaction and Dispersion
 - how fluid disperses as it travels through a packed or open tube. Understanding tracer measurements on packed beds. How to formulate the correct boundary conditions for a packed bed reactor.

6. Dynamic Stability of CSTRs

• how to determine if a reaction undertaken in a CSTR will be stable or will undergo oscillations.

Teaching Materials

Advice on suitable background reading will be given in lectures.

It is expected that one or two revision lectures will be given in the Easter Term, depending on demand.

Unit				
Pharmaceutical Engineering				
Level	Term		Duration	
CET IIB		LT 2022	16 lectures	
 The pharmaceutical industry contributes a key part to the UK economy and it stands out as one of the nation's largest manufacturing exporters. There are ample opportunities for chemical engineers to contribute their expertise in this sector. The industry is a major energy consumer and manufacturing practice sometimes lags behind other process industries (such as food) even though product quality is critical. Aims This course aims to give students an understanding of the fundamentals of pharmaceutical engineering. It introduces the subject and builds on established concepts from general chemical engineering to highlight specific applications and requirements of this industrial sector. <i>Learning Outcomes</i> On completing this course and the associated problem sheets, students should be able to: Understand the complex requirements set by pharmacological efficacy, formulation, primary and secondary manufacturing as well as the regulatory framework that govern this global industry Have an appreciation for the cultural differences between the R&D and manufacturing environments Understand the different type of dosage forms manufactured by the industry (solids, semi-solids and liquids) Know the major unit operations currently in place for batch production Understand the barriers that prevent further improvements to the quality of medicines using present manufacturing technologies Understand the state of the art in the drive towards continuous production, quality-by-design and process analytical technology 				
Assumed Knowledge Material Chemical thermoo Heat and mass tra	lynamics; reaction kine	etics	Source CET I and CET IIA CET I	
Connections To Other	· Units			
Pharmaceutical engineering is an extension to the general chemical engineering principles that the students have become familiarised with throughout CET I and IIA.				
Self Assessment				
This course was taught for the first time in 2015-16. Past exam papesrs: CET IIB 2016-19 Paper B3.				
Assessment				
The material from this unit is assessed by written examination.

Adsorption and advanced nanoporous materials	Dr D. Fairen-Jimenez
Synopsis	

Section 1: adsorption

The unit will start with a brief review of the adsorption phenomena and in particular adsorption in porous materials and will include a clarification of the main terminology and the principal definitions.

The differences between absorption and adsorption, physisorption, and chemisorption will be described, followed by an explanation of the main forces that cause adsorption. It will provide a description of the fundamentals of adsorption, with an introduction about the classification of adsorption isotherms based on their performance and characteristics including the classification of the porosity of materials based on size.

Section 2: porous materials

The unit will bring a description of nanoporous materials such as activated carbons, zeolites, metal-organic frameworks (MOFs) and porous coordination polymers (PCPs). It will go about their history and will bring a state-of-the-art description of their properties of interest. It will cover some of their advances in synthesis.

Section 3: adsorption theory

The unit will provide a detailed description of how gas adsorption is used for porous materials characterization, giving a detailed description of typical methods employed. It will go through the different adsorption theories, including Polanyi and Langmuir, and will move to the modelling of adsorption phenomena using BET, Horwath-Kawazoe, t-plot, BJH, and DFT models. This will include some examples of calculations in different adsorption isotherms.

Section 4: high-pressure gas adsorption

The importance of gas adsorption theory to evaluate the performance of porous materials will be evaluated. This includes questions about how to perform high-pressure adsorption in single component and mixtures and the main issues found in the process. This will be related to pressure swing and temperature swing adsorption processes generally applied in industry.

Section 5: novel porous materials

The importance of new properties found in porous materials will be explored, including high porosity materials, unsaturated metal centres, and flexibility.

Section 6: industrial applications of porous materials

Gas and liquid-phase adsorption applications will be discussed, including carbon capture, hydrogen adsorption and drug delivery processes.

Optical Microscopy	Prof. C.F. Kaminski
Synopsis	

Fundamental Background

- A brief history of the microscope
- Concepts of image formation
- Mathematical background: the Fourier transform (and its importance for image formation and resolution)
- The problem of optical diffraction and its effect on image resolution: Point spread and optical transfer functions
- Microscope resolution, contrast and sensitivity
- Interrogating molecules: light absorption, emission, and scattering
- The technology: lasers, lenses, cameras, and all that

Basic Microscopy techniques

- Brightfield microscopy
- Fluorescence microscopy: Obtaining chemical specificity
- Coherent and incoherent imaging
- Improving image contrast: Confocal microscopy

Sample preparation techniques

- Synthetic fluorophores
- Fluorescent proteins, antibodies, and labelling of biological samples.

Advanced Techniques

- Imaging the molecular environment: Fluorescence lifetime microscopy and polarisationresolved imaging.
- Detecting single molecules
- Optical super-resolution techniques: resolving objects smaller than the wavelength of light

Image processing techniques

- Deconvolution of image noise
- Contrast enhancement techniques
- Object identification and tracking

Applications

- Microscopy for chemical detection and process control
- Gene sequencing
- Imaging in living systems and uncovering molecular mechanisms of disease
- Imaging whole organisms

Teaching Materials

No book covers the course material exactly; most books are either too basic or too advanced for the purpose of this course. However the following are outstanding web resources that illustrate aspects of thecourse. They contain interactive Java tutorials which allow you to see different modes of imaging and to explore physical concepts:

- The optical microscopy primer website: <u>http://micro.magnet.fsu.edu/primer/index.html</u>
- The *microscopyu* website: <u>http://www.microscopyu.com/</u>

Synopsis	

- 1. Introduction
- 2. Quantitative Biology
 - Demonstration on how diverse aspects of living systems are underpinned by the physics of complex systems.
 - Modelling based on physical principles to complement experimental investigations.
 - Overview of quantitative cell biology including primer lectures on cell biology for chemical engineers.
- 3. Energy balance of Living Systems
 - Examination of life from a biophysicist's perspective and application of some thermal and statistical models for living systems with examples ranging from motor proteins to cooperative binding.
 - Impact of energy balance on protein folding/misfolding, on determining the structure function relationship of proteins, on molecular motors, etc.
- 4. Biophysical Techniques
 - Introduction to various biophysical techniques such as atomic force microscopy, NMR, transmission electron microscopy, mass spectrometry, etc.
 - Specific applications of the various techniques in living systems will be discussed.
- 5. Optical Techniques
 - A brief introduction to various optical techniques (super-resolution microscopy, optical tweezer, Foerster resonance energy transfer etc.) will be given and their application in living systems willbe discussed
- 6. DNA origami and nanofabrication
 - How biological systems can be exploited to produce nanostructures, such as DNA origami and how nanofabrication, such as lab-on-chips can be exploited to study living organisms in a fully controlled environment.

Languages	D. Tual (Dept of Engineering Centre for Languages and Inter-
	Communication)

The following languages are available at Beginner, Intermediate and Advanced levels of study:

- French
- German
- Spanish
- Chinese
- Japanese

Further information can be found on CLIC's website at: https://www.clic.eng.cam.ac.uk/

Chemical engineers are only permitted to choose one language (at one level).

Teaching Materials

A list of useful resources will be provided.

Research Project Level Term BT 2021; LT start of ET 2022 Duration MT to week 3 of ET Background MT could (LT start of principles, developing are experimental methods, and developing new computational methods. Applied) research includes developing an innovative process, measuring parameters or modelling an existing process with a view to improving it, and developing a new product. Aims The aim is for students to develop research skills and experience the trials, tribulations and satisfactions of original research. This helps qualify students, in part, to undertake, commission or supervise such work. Learning Outcomes The aim is for students should be able to: Execute and the research or most projects, students should be able to: or assess the risk associated with the research perform work safely and complete relevant safely documentation Execute and formation from the scientific literature of aign experimental work and/or perform computer programs Execute and formation from the scientific literature owork as part of a team Source This will vary from project. Connections To Other Units Students are recommended to attend any CET IIB modules that are directly related to their research project. Some research projects will have no direct connection to units within the Chemical Engineering Tripos. Sdf Assessment Students have weekly meetings with their supervisor to discuss progress.	Unit			
Level CET IIB Term MT 2021; LT start of ET 2022 Duration MT to week 3 of ET Background Chemical engineers are often involved with research. Fundamental research includes understanding scientific principles, developing new experimental methods, and developing new computational methods. Applied research includes developing an innovative process, measuring parameters or modelling an existing process with a view to improving it, and developing a new product. Aims The aim is for students to develop research skills and experience the trials, tribulations and satisfactions of original research. This helps qualify students, in part, to undertake, commission or supervise such work. Learning Outcomes Learning Outcomes will vary from project to project. For most projects, students should be able to: • assess the risks associated with the research • perform work safely and complete relevant safely documentation • extract relevant information from the scientific literature • design experimental and/or modelling results • undy as part of a team • preform experimental work and/or perform computational simulations • perform experimental work and/or perform computational simulations • present work by oral presentation and poster • write a dissertation on the project. Connections To Other Units Source Students are recommended to attend any CET IIB modules that are directly related to their research project. Source scarch projects will have no direct connection to units within the Chemical Engineering Tripos. Self Assessment Sudents are directly meetings with their supervisor to discuss progress. Unit	Staff
Research Project	Dr Joanna Stasiak (coordinator)

Each student undertakes a major project, usually in collaboration with another student, supervised by a member of academic staff. Students should meet with their academic supervisor weekly to discuss progress and future work. The supervisor may allocate one or more mentors, such as PhD students or post-doctoral workers, to assist with the day-to-day running of the project.

All students undertake a safety training course at the start of Michaelmas Term.

Students are expected to spend 10 hours per week in Michaelmas Term and Lent Term on the research project. Students may choose to work more hours on the project than this minimum, but should be aware that they need to strike a balance between work on the research project and on other elements of the course. Members of academic staff have been informed of this fact.

Students are expected to perform additional work over the vacations (e.g. data analysis, report writing), but are not normally expected to perform laboratory work during the vacation.

Students give a 6-minute oral presentation and a poster presentation on their project towards the end of Lent term.

Students submit a dissertation (maximum length of 40 pages) on their project in Easter term. The dissertations are marked independently by two Examiners.

Teaching Materials This will vary from project to project.
